Econstruction

Econstruction provides technical services to the construction industry, through software packages that facilitate the project management of large construction jobs throughout North America and Dubai. Econstruction's mandate was to move their employees out of traditional cubicles that can make individuals feel isolated. Cubicles would be replaced by an open plan that would allow co-workers to easily interact with each other in order to fulfill client projects.

Up was the system was chosen as the most functional and reflective of Econstruction's culture. They realized that the Up post and beam system would best suit the dynamics of their growing team and understood that Up would be the best investment for the long term. Up's ergonomic considerations allow employees to feel more comfortable, happy and ultimately more productive in their new stations compared to their previous, cubicle-style space. Access to natural light for all employees was provided by the use of lower partitions and translucent add-on screens. The simplicity of Up's exposed wire management and electrical access made the integration with Econstruction's communication system a seamless process.
